

Depending on the specific model of your engine, you may need to reuse the choke assembly from your old carburetor. To do this, follow these steps:

- 1) On the new carburetor, unscrew the 2 screws holding the choke plate onto the choke shaft.

- 2) On the opposite side of the choke linkage attachment, remove the C clip from the choke shaft and slide the choke shaft out of the carburetor.

- 3) Remove the choke linkage from your old carburetor.
- 4) Reattach the choke linkage from your old carburetor on to the new carburetor.
